

Don't Skip Security Updates:

Security Updates Protect your laptop, desktop, mobile devices, and the appliances in your home.

Security updates aren't something to ignore. They fix issues that are currently allowing attackers to get to your data or compromise your devices. Ignoring them leaves you vulnerable, especially when you're in public places or travelling.

We recommend doing updates for Windows computers and mobile devices as soon as they become available.

- ✓ A security update fixes holes that attackers have already discovered.
- ✓ Ignoring updates is the problem: Windows Updates, iOS or Android Updates can leave your devices vulnerable to cyber attacks.
- ✓ Running outdated software or OS Versions can be dangerous to NH: Your personal devices may contain sensitive data that remains unprotected if you don't do updates.
- ✓ Home networks are particularly vulnerable to attack: Patching your "internet of things" devices, like major appliances, home wifi routers, and cameras helps keep your home networks secure.

Personal Accountability

It is your responsibility to keep yourself, your homes, and your community safe. Cyber criminals count on your skipping updates, not having time, or just simply not checking to see if updates are available. This makes you an easier target.

Places to check for updates:

Your laptop or desktop using windows updates.

Your Apple or Android cell phone and tablet (don't forget your kids' devices!).

Apps that connect to major appliances in your home.

Security systems, alarms, connected door locks, and video game consoles.

Wifi Routers given to you by your internet provider.

Staying Updated Protects Everyone!
